## **KARBON ZERO EXPANDS SCOPE OF SERVICES**

**Albuquerque, NM** — Karbon Zero LLC, a leading local renewable energy firm, has recently expanded their scope of services and expertise—namely, the addition of a complete GIS and digital mapping department. “Mapping is a critical aspect of any assessment, feasibility, or development undertaking. It provides accurate tangible information,” stated Daniel St. Germain, GIS Director and senior cartographer. Dealing with property raised many important concerns, especially concerning the locations of homes, roads and boundary lines. Mapping provides the essential overview of these issues.

GIS and digital mapping facilitates 3-D terrain modeling and enables a more inclusive picture for evaluation of potential wind and solar sites. With this new service, Karbon Zero can generate comprehensive views of critical site details such as wind resources, access roads, turbine placement and surrounding habitat. “The maps are high-resolution and extremely accurate and allow us to optimize project evaluation and placement.” explained Ednen Hindi, Karbon Zero President.
